

# coolsculpting®

Procedures that use laser, sonic waves and even surgery to remove fat can actually destroy other tissue in the process by burning, shattering or extracting non-fat cells. This requires downtime for your body to heal. Fortunately, CoolSculpting doesn't burn, shatter or extract any cells.

Developed by Harvard scientists, our unique, FDA-cleared, patented procedure uses a targeted cooling process that kills the fat cells underneath the skin, literally freezing them to the point of elimination.

Only fat cells are frozen.

Your healthy skin cells remain, well, healthy.

No knives. No suction hoses.

No needles. No scars.

Once crystallized, the fat cells die and are naturally eliminated from your body.

In a few months, say hello to a new you

Mother Nature, lifestyle or gravity. No matter the culprit, many of us have bulges of stubborn fat.

Those unwanted bulges contain fat cells which can be resistant to diet and exercise, but not to CoolSculpting.

CoolSculpting uses controlled cooling to target and crystallize fat cells.

Crystallized fat cells gradually die off, then are naturally eliminated from your body.

In the weeks and months following treatment, remaining fat cells condense, reducing the fat layer.

CoolSculpting lets you say goodbye to stubborn fat.
